Sustainable Ecosystems: and the Built Environment Guy Battle, Christopher McCarthy

Sustainability is arguably the most vital concern in architectural design today. As the world becomes ever more densely populated, with the majority of people now living in cities, it is essential for architects, engineers and urban planners to be fully aware of the impact of their activities on the natural environment, as well as the effects of buildings on their occupants. Sustainable Ecosystems and the Built Environment offers guidelines for professional practice and highlights the potential of radical new technologies to increase and maintain the quality of life on this planet. Compiled from a series of articles which appeared in the cutting-edge journal Architectural Design, it examines topics related to the effect of buildings on both their immediate environment and the global ecosystem, as well as methods of making buildings healthy places to live and work - from heating, lighting and air circulation to the use of colour and odour to affect mood. All the key issues of sustainability are discussed, and backed up with evidence from 'green' projects in which the authors' sustainable engineering firm Battle McCarthy has been involved. This book offers an informative, practical and thought-provoking read for anyone involved in the design of the built environment.
